Item 14539

16. Write your response to question 16 in the space below.

The canyon might have been shaped by erosion. In the picture the little place where the side fell, that's erosion. A rapid thing that could of shaped this canyon is the stream.

16. Write your response to question 16 in the space below.

By flowing water because the water can help wash away some of the loose rocks, and minerals. I think this because there are boulders in the stream.
A more rapid way is by landslides, such as rock slides or mud slides. This will help form the edges. I say this because there is a picture of an alcove in the canyon by a bunch of fallen rocks and pebbles.

16. Write your response to question 16 in the space below.

Weathering could help shape the rock I can
tell because theres little pebbles and
boulders

16. Write your response to question 16 in the space below.

The river slowly dug the canyon deeper. The river is the evidence.

Mud slides are the rapid process. The evidence is the rocks that have fallen from erosion.

16. Write your response to question 16 in the space below.

The thing that shape the canyon is the Boulders because they are on the outside of the stream and because how big they are.

16. Write your response to question 16 in the space below.

A slow process that probably helped shape the canyon was erosion. Some evidence is that there is rocks (boulders) that have fallen out of the canyon. There is also some evidence that the canyon has been there a few years from the lines in the middle of it.

An earthquake could of also struck that spot. The boulders could of fallen from the top of the canyon.

16. Write your response to question 16 in the space below.

Erosion is a process that could have formed the canyon, a river on the desert like surface could have wore or broke through the rock to create a canyon. Evidence of this process is the stream. A flood could have made this canyon. Water could have gone through cracks in the rock and made the cracks bigger to form a canyon. Evidence is the stream.

16. Write your response to question 16 in the space below.

A slow process that would have shaped the canyon is erosion. I can tell because of the rock layers in the canyon walls and there are not many plants to hold the soil down.

A rapid process that could have shaped the canyon could be rock slides because there is a big cut in the canyon and at the bottom of the cut there are lots of boulders and pebbles. There are lots of pebbles and boulders in other places too.

16. Write your response to question 16 in the space below.

A long time ago a iceberg could have shaped the canyon. A fast way the canyon could have shaped is a astroid could have hit there.

16. Write your response to question 16 in the space below.

Weathering helped shape the canyon. The landslide by the canyon is evidence of weathering. Water is a rapid process that hits at the rocks.
